

Contact Layer Dressings

McKesson contact layer dressings are sterile, versatile dressings that can be used on a variety of different wounds when used with an outer absorbent dressing. The thin transparent dressing is made from polyurethane film and silicone gel with an open perforated structure. These dressings conform to the shape of the wound, while the open perforated structure allows exudate to pass vertically into the outer absorbent dressing and enables easy delivery of topical treatments. They prevent the outer absorbent dressing from sticking to the wound or the skin around the wound. They can also be used as protective layer on superficial wounds that are not discharging and on areas of skin that are very fragile.

Features and Benefits

- Channels allow exudate to transfer vertically into a secondary absorbent dressing and aid delivery of topical treatments
- Designed to allow wound fluid to easily transfer into a secondary dressing
- Protects the wound and the skin
- Prevents an outer dressing from sticking to the wound
- Because the dressing is translucent, it allows the caregiver to assess the healing progress without having to remove the dressing
- Not made with natural rubber latex
